

Low-exposure rates can destabilize transfer-fee predictions

Existing Model 4 evaluations. Screening changes the population; it is not a controlled treatment.

Old predictions already recover on retained 2022-23 cases. Refitting does not explain the full gain.

The 270-minute rule followed earlier OOS failures and was fixed before reruns. It is not an optimal cutoff.

450 and 900 minutes are sensitivities. Individual extreme errors do not dominate the plotted scale.
